

## Are the splicing methods for bare fiber and pigtail the same

### Overview

The bare fiber end is designed to be fusion spliced or mechanically spliced to the fiber optic cable in the field. This design makes pigtails the ideal choice for applications where fibers from a large cable must be terminated at an ODF (Optical Distribution Frame) . Executive Summary: A fiber optic pigtail is one of the most commonly specified yet least understood components in structured cabling. By combining factory-installed connectors with spliced bare fiber, pigtails ensure that network installers can create fast, reliable, and cost-effective terminations. Without pigtails. Common termination methods include no-epoxy-no-polish, epoxy and polish and pigtail splicing. Regardless of the method, the beginning steps are the same.

Fiber cable termination

In order to terminate a Fiber Optic cable, the appropriate connector must be determined. The type of fiber-optic adapter that the terminated cable will connect to will dictate which connector will be used. The most common types that are added to fiber optic cable in inside plant environments are LC, SC, ST, and FC. Some fiber connectors are pre-polished mechanical connectors for ease of installation or anaerobic connectors which require cleaving and polishing.
