

Can the distribution box be moved horizontally

AI Overview

Yes, a distribution box or group of objects can be moved horizontally, provided the software allows horizontal distribution and the objects are selected properly. Horizontal Movement and Distribution In most design and layout software, horizontal movement of a distribution box involves either manual dragging or using a distribute function to maintain even spacing between objects. To move objects horizontally: Select all objects within the distribution box. This can usually be done by holding the Shift key and clicking each object or dragging a selection box around them (PowerPoint). Use the Distribute Horizontally feature. This arranges the interior objects evenly between the leftmost and rightmost objects without changing the bounding box size. Move the entire group. Once distributed, the group can be dragged horizontally to a new position while maintaining the relative spacing between objects. Software-Specific Notes PowerPoint: Go to the Home tab → Arrange → Align → Distribute Horizontally. This ensures consistent spacing along a row. Figma: Horizontal distribution requires setting the auto layout direction to horizontal (row). Freeform or vertical layouts may prevent horizontal distribution. LightBurn: Offers Distribute H-Spaced and Distribute H-Centered options to evenly space objects along the horizontal axis. The Move Together tool allows the entire selection to shift horizontally while keeping edges aligned. Miro: Objects inside frames may need to be moved out temporarily to access horizontal distribution controls. Practical Tips Ensure all objects are unlocked and selectable; locked objects cannot be moved or distributed. The outermost objects define the horizontal boundaries; interior objects are spaced evenly between them. If objects overlap, the distribution tool may create equal overlap rather than positive spacing. After distribution, the entire box or grou...
