

# How to adjust the router in a mobile fiber optic box

## AI Overview

To optimize your mobile fiber optic internet, connect your router to the ONT via Ethernet, configure the router settings through its admin panel, and ensure Wi-Fi security and placement are optimized.

**Step 1: Verify Equipment and Compatibility**

**Optical Network Terminal (ONT):** This device converts the fiber optic signal into Ethernet for your router. It is usually provided by your ISP and must be installed near the fiber entry point.

**Router:** Ensure your router has a Gigabit Ethernet WAN port and supports high-speed connections. Wi-Fi 6 or 6E routers are recommended for better performance.

**Cables:** Use the Ethernet cable provided or a high-quality Cat5e/Cat6 cable to connect the ONT to your router.

**Step 2: Physical Connection**

Connect the fiber optic cable from the wall outlet to the ONT's input port, handling the connector carefully to avoid damage. Power on the ONT and wait for the status lights to stabilize (usually 2–5 minutes).

Connect the ONT's LAN/Ethernet port to your router's WAN port using an Ethernet cable. Power on the router and wait for its indicator lights to confirm a successful connection.

**Step 3: Router Configuration**

Access the router's admin panel via a web browser (commonly at 192.168.1.1) and log in with the default credentials. Enter your ISP credentials if required (username and password provided by your ISP).

Update the router firmware to the latest version to ensure security and performance.

Configure Wi-Fi settings: set a strong password, choose a unique network name (SSID), and select the appropriate frequency band (2.4 GHz for range, 5 GHz for speed).

**Step 4: Optimize Placement and Performance**

Place the router in a central, open location to maximize coverage. Avoid placing the router near walls, metal objects, or electronic devices that may interfere with the signal.

Check the LED indicators: Power, Internet, and Wi-Fi lights...
