

How to connect composite optical cables in series

AI Overview

Composite optical cables can be connected in series using LC connectors, distribution boxes, and BiDi SFP modules to maintain both optical and electrical continuity. Understanding Composite Optical Cables Composite fiber optic cables combine fiber optic strands for data transmission and copper conductors for power or additional data within a single sheath. They are commonly pre-terminated with LC connectors and labeled for easy identification, which simplifies series connections.

Step-by-Step Guide to Connecting in Series

Prepare the Cables Remove the protective outer tube of the composite cable. Separate the fiber optic strands from the copper wires. Inspect the fiber ends for damage and clean them using specialized fiber cleaning tools.

Use Distribution Boxes Run the first cable into a hybrid distribution box. Connect the fiber strands to the LC adapters inside the box. Connect the copper wires to the DC terminal block for power delivery. Secure the cable along its route using clamps or hangers to prevent stress or bending.

Connect to Media Converters Plug a BiDi SFP module into the SFP slot of a fiber PoE media converter. Use a fiber patch cord to connect the LC adapter in the distribution box to the media converter. Connect the copper wires to the power supply terminals on the converter.

Extend the Series Run the next composite cable from the first distribution box to the second distribution box near the next device. Repeat the process: connect fiber strands to LC adapters and copper wires to the terminal block. Use another fiber patch cord to link the second distribution box to the next media converter or device.

Verify Connections Power on the system and check that all devices are receiving power and data. Test the optical signal using standard network testing tools to ensure minimal signal loss.
