

How to install partitions in a distribution box

AI Overview

To install partitions, you need to manually create and assign root, home, and swap partitions on your storage device, selecting appropriate filesystems and sizes before proceeding with the OS installation. Understanding Partitions Partitions divide a physical storage device into logical sections, each acting as an independent storage unit with its own filesystem and purpose. Common partition types include: Primary Partitions: Basic partitions; one can be marked as the boot partition. Extended Partitions: Allow creation of multiple logical partitions beyond the primary partition limit. Logical Partitions: Created within an extended partition, functioning like primary partitions. Swap Space: Acts as virtual memory when RAM is full. Root Partition (/): Contains the operating system and installed applications. Home Partition (/home): Stores user data and personal files separately from system files .Step-by-Step Installation Backup Data: Before partitioning, back up all important files to prevent data loss .Boot from Installation Media: Use a USB or DVD with your Linux distribution. Enter BIOS/UEFI and set the boot order to prioritize the media .Select Manual Partitioning: On the installation type screen, choose options like "Something else" (Ubuntu) or manual partitioning (Pop!_OS) to gain full control over partitions .Create Partitions: Root (/): Allocate at least 20GB; use EXT4 for reliability or Btrfs for snapshot support. Home (/home): Allocate remaining space for user data; EXT4 is recommended. Swap: Allocate equal to or double your RAM size (e.g., 16GB swap for 8GB RAM). For systems with large RAM, a smaller swap may suffice .Optional Advanced Setup: LVM (Logical Volume Management): Allows flexible resizing and spanning multiple disks. Separate partitions for specific applications: Useful for Docker, games, or large datasets .Assign Mount Points and Filesystems: Ensure eac...
