

How to reserve wires for the distribution box

AI Overview

Reserve wiring in a distribution box by planning space for future circuits, arranging wires neatly, and leaving designated positions for expansion. Planning and Reserved Positions When wiring a distribution box, reserve space for future circuits by placing the reserved positions typically on the right side of the box while arranging existing circuit breakers from left to right. This allows easy access for adding new breakers or circuits without disturbing the current setup. Consider the total load capacity and leave extra room for potential upgrades. Wire Arrangement and Color Coding Phase wires: A phase (yellow), B phase (green), C phase (red) Neutral wire: Blue Ground wire: Green/yellow striped Wire specification: Use 2.5mm² for lighting and sockets, 2.5–4.0mm² for air conditioning or heavier loads. Wires should be routed from the main breaker to branch breakers on the left, and outgoing wires should exit on the right. This directional planning helps maintain a clean layout and simplifies future expansion. Binding and Neatness Use plastic cable ties to bind wires, ensuring uniform spacing and straight runs. Avoid tangling or crossing wires unnecessarily. Leave extra length for each wire to allow for adjustments or future connections, but avoid excessive slack that could cause clutter or heat buildup. Terminal Connections Connect phase to phase terminals, neutral to neutral, and ground to ground. Use a wire stripper or screw terminals to ensure tight, secure connections. Clearly label each circuit to facilitate maintenance and future wiring additions. Safety Checks Perform an insulation resistance test to verify proper insulation between wires and the box. Conduct a circuit on/off test with a multimeter to ensure no short circuits or broken connections. Ensure all wiring complies with local electrical codes and standards such as NEC or IEC.
