

Maximum distance of multimode dual-core optical fiber

Overview

Multimode fiber optic cable has a larger core, typically 50 or 62.5 microns that enables multiple light modes to be propagated. 5 μm and comes with an orange jacket. With a 200 MHz/km bandwidth, OM1 fiber can transmit up to 275 meters for 1 Gigabit Ethernet and 33 meters for 10 Gigabit Ethernet. However, it is more commonly used. This guide covers the actual distance limits for OM3 and OM4 multimode fiber at every common data rate, what determines those limits, and when to stop fighting multimode and switch to single mode. MMF is widely used in data centers for. Multimode Fiber (MMF) has a core diameter, typically 50–100 micrometers, has ability to transfer multiple modes of light through the fiber core, uses lower-cost electronics (LED, VCSEL) operates at the 850 nm and 1300 nm wavelength and is used for short distance interconnections (up to 550m). Multimode fiber has a larger core (typically 50 μm or 62.5 μm). This causes modal dispersion — signals spread out over distance, limiting how far data can travel before degrading.

Multi-mode optical fiber is a type of optical fiber mostly used for communication over short distances, such as within a building or on a campus. Multi-mode links can be used for data rates up to 800 Gbit/s. Multi-mode fiber has a fairly large core diameter that enables multiple light modes to be propagated and limits the maximum length of a transmission link because of modal dispersion. The standard G.651.1 defines the mos
