

Reliability Algorithm for Fiber Optic Cable Network Structure

Overview

An engineering methodology for the mechanical reliability of optical fiber is developed within a fracture-mechanics framework. The model expresses allowable in-service and installation stresses as a fraction of fiber strength in a fatigue environment for a range of n values and. Refraction is the change in direction of a light wave as it passes from one medium to another and is described by Snell's law (see equation 1, where i is the incident light wave and r is the refracted light wave). The refractive index (n) is a material property that characterizes this change. Glass fiber's strength and reliability has been researched thoroughly. Fiber is proof tested at manufacture to "weed out" flaws in the extrinsic region. Install stress and long term stress of the glass is limited by standards to ensure the fiber lifetime. Thus a relatively low failure probability, such as 10^{-6} defines non-zero dispersion-shifted single-mode fiber and describes geometric, mechanical, and transmission attributes relevant to long-distance and wavelength-division use cases.
