

## **Requirements for the three-level electrical distribution box of the suspended platform**

### **AI Overview**

A three-level electrical distribution box for a suspended platform must follow hierarchical wiring, separate power and lighting circuits, minimize distribution distances, and meet strict environmental and safety standards.

**Hierarchical Wiring and Branching** The three-level distribution system must adhere to the hierarchical and branch circuit principle, meaning no equipment should bypass any level. The main distribution board and subordinate distribution boards must not be directly connected to other equipment outside their designated hierarchy, ensuring proper load management and system integrity ( ).

**Separation of Circuits** Power and lighting circuits should be installed separately. If combined in the same distribution board, they must have independent branch circuits. Switch boxes for power and lighting must also be separate, with no shared enclosures ( ).

**Minimizing Distribution Distances** The main distribution board should be located near the power source. Distribution boards should be placed where electrical loads are concentrated. Distance between a distribution board and a switch box should not exceed 30 meters, and the horizontal distance from a switch box to its controlled equipment should preferably be under 3 meters ( ).

**Environmental and Safety Requirements**

**Protective Environment:** Install in dry, well-ventilated areas at normal temperature. Avoid locations with harmful gases, excessive moisture, mechanical impact, vibration, liquid splashing, or heat radiation. Protective measures must be implemented if hazards exist ( ).

**Maintenance Environment:** Provide sufficient space for two persons to work simultaneously around the distribution box. Keep the area free of obstructions, shrubs, or weeds ( ).

**Operati...**
