

A black zippered tool kit is shown open, revealing its contents. The kit includes a screwdriver with a white handle, a pair of yellow-handled pliers, a pair of green-handled wire cutters, and a small clear plastic container filled with screws. The tools are secured with black straps. The kit is set against a white background.

Distribution boxes are essential components in electrical systems, and they come in various types designed for specific applications, including Main Distribution Boards, Sub Distribution Boards, and Smart Distribution Boxes.

Common Types of Distribution Boxes

- Main Distribution Board (MDB):** This is the central hub for distributing electricity to various circuits within a building. It controls the overall power supply and includes components like circuit breakers and bus bars to manage electrical loads safely.
- Sub Distribution Board (SDB):** Used to distribute power from the main board to specific areas, such as different floors or sections of a building. SDBs help manage electrical loads more efficiently and are commonly found in residential and commercial settings.
- Meter Panel:** This type tracks electricity usage and is typically found in residential and industrial settings. It includes components like primary switches and fuses to monitor and control power consumption.
- Smart Distribution Boxes:** Equipped with advanced features such as remote monitoring and energy management, these boxes are designed for modern electrical systems, allowing for real-time data collection and automation.
- Surface-Mounted Distribution Boxes:** These are installed directly on walls and are easier to access, making them suitable for outdoor or industrial environments.
- Flush-Mounted Distribution Boxes:** Embedded within walls, these provide a cleaner look for indoor installations and are often used in modern homes and offices.
- Control Boxes:** Specialized distribution boxes designed to control electrical equipment or systems, often including switches and monitoring instruments.
- Fuse Boxes:** An older type of distribution panel that uses fuses instead of circuit breakers to protect electrical circuits. While less common today, they are still found in some older buildings.
