

Why can't the optical module be replaced

Overview

Built-in optical modules cannot be replaced. An optical module is a critical component in modern optical communication systems, directly affecting transmission stability, network reliability, and operational efficiency. However, during installation and daily operation, various issues may arise. Ensure that the new optical module has the same center wavelength and complies with the same. Customers in the use of optical modules will more or less encounter a variety of failure problems, such as optical module model selection is correct, the use of jumper is correct and some common problems, customers have the ability to judge and have a clear solution, but for some of the use of. Problem 1: The optical port lamp does not light up after the two optical modules are interconnected Cause 1: The parameters of the optical modules at both ends do not match, such as wavelength, rate and transmission distance. Cause 2: The type of optical jumper used does not match the optical. Based on typical issues encountered with optical modules in daily switch applications, this document summarizes basic troubleshooting steps for resolving common faults: 1.
